TITLE

CLEARCOAT COMPOSITION HAVING BOTH WINDSHIELD SEALANT AND RECOAT ADHESION

ABSTRACT

A film-forming coating composition, typically a topcoat, having improved adhesion. The composition includes a film-forming binder comprising a carbamate material, a curing agent, typically a melamine curing agent, and a hydroxy functional silane component. When used as a clearcoat over a standard pigmented basecoat, the resulting coating provides excellent adhesion to both windshield sealants and additional repair coatings.
